Profile

I am a backend developer and I work mostly with Python. I study Data and Software Engineering at Universidad de San Buenaventura and I am a co-founder of JIBU, a software startup in Medellín where I built ConciliaIA, a payment reconciliation platform. Before that I spent two years testing software, which left me with the habit of checking my work carefully before I hand it over. I am looking for a backend or applied AI role.

Experience

JIBU, co-founder and developer Oct 2026 to present

- I started the company with two partners. We build AI automations, custom software and ConciliaIA, our main product.
- I built all of ConciliaIA. It reads payment receipts with an OpenAI model and compares them with the bank movements using fixed rules. If the payment is not in the bank, the order goes to review and is not delivered.
- I built the real-time register view with WebSockets, the daily close against the accounting ledger and the accounting entry proposals. I used Python, FastAPI, PostgreSQL and Supabase.
- I separated each client's data with Row-Level Security and followed Colombian data protection law (Law 1581).
- I set up agents in Claude Code for the company's content and lead search. I review what they produce before using it.

TapBio, founder

- I sell acrylic table stands with NFC and QR to businesses.
- I built a dynamic QR system with FastAPI and Supabase: the QR is printed once and its destination can be changed from a phone.
- I made a payment page for a business that shows the account holder, the business name, payment keys to copy and a button that opens the customer's bank.

Freelance developer and personal projects

- APIs with FastAPI, real-time integrations with WebSockets, data analysis with Pandas and NumPy, and deployment with Docker on Linux.
- Personal finance bot on Telegram, built with Python, Gemini API, PostgreSQL and Google Sheets.
- 2026 World Cup results predictor using Poisson regression and ELO ratings.

I.E. Presbítero Luis Eduardo Pérez Molina, QA and technical support (freelance) Jan 2024 to Jan 2026

- I tested the school's web platform, the enrollment module and the grading system.
- I logged bugs in Jira with the steps to reproduce them and their priority.
- I ran smoke and regression tests before each enrollment period.

Skills

Languages: Python, SQL

Backend: FastAPI, REST APIs, WebSockets, SQLAlchemy

Data: PostgreSQL, Supabase, SQLite, Pandas, NumPy

AI: OpenAI API, Gemini API, Claude Code

Tools: Docker, Linux, Git, GitHub, Postman, Jira

Testing: functional, integration and regression

Education and courses

Data and Software Engineering, Universidad de San Buenaventura, Medellín. Fourth semester.

Completed courses: Intermediate Python and Python Fundamentals (Platzi, 2026), ethical hacking, and artificial intelligence courses from Mastercard and Bancolombia.

Courses in progress: AI Engineering (Platzi) and Data Analysis (Coursera).

Other venture: Luna Turquí, jewelry for pets.
